```

```
require(qetx)
```

2
The Measurement Process

2.1 Winsorized Mean and Standard Deviation

The following sulfate concentrations (mg/L) were measured during a routine water quality survey of the Savannah River (South Carolina). The data is available in the `qetx` package [1]:

[1] Note that in this case you do not have to assign the data to a name.

```
data(so4)
```

```
so4

##  [1] 1.3 2.3 2.6 3.3 3.5 3.5 3.6 4.0 4.1 4.5 5.2 5.6
## [13] 5.7 6.1 6.2 6.5 6.9 7.1 7.7 7.9 9.9

length(so4)

## [1] 21

mean(so4)

## [1] 5.119

sd(so4)

## [1] 2.137
```

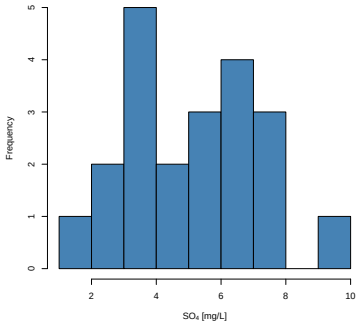

Figure 2.1: A histogramm of the so4 data.

So there are 21 measurements with a mean of 5.12 mg/L and a standard deviation of 2.14 mg/L.

Suppose we have a detection limit of 2.5 mg/L and want to winsorize values below LOD, i.e. replace the two lowest values by 2.6 mg/L and the two highest values by 7.7 mg/L.

Happily there is function in the `qetx` to do this for us: `winsor()`. This function takes a vector of values and a second argument specifying how many values should be winsorized (either by giving a LOD-value or the number of values on each side) [2].

[2] Look at the source of this function - type the function name into the console - to see which computations are done.

```
so4_w <- winsor(so4, lod = 2.5)
so4_w

##  [1] 2.6 2.6 2.6 3.3 3.5 3.5 3.6 4.0 4.1 4.5 5.2 5.6
## [13] 5.7 6.1 6.2 6.9 6.5 7.1 7.7 7.7 7.7
## attr(,"width")
## [1] 2
```

This give the expected results, moreover we see that on each end two observations where modified [3].

[3] stored within the attribute 'width' of the resulting vector. **TODO: verbatim within sidenote.**

```
mean(so4_w)

## [1] 5.081

sd(so4_w)

## [1] 1.792

sd_winsor(so4_w)

## [1] 2.24
```

The Winsorized mean ($\bar{x}_w$) now is 5.08 mg/L, the standard deviation of the modified data set (s) is 1.79 mg/L and the Winsorized standard deviation (s_w) 2.24 mg/L.

2.2 Probability Plotting

3
Bioaccumulation

4
Tests for Detection of Chronic Lethal and Sub-lethal Stress

5
Lethal and Other Quantal Responses to Stress

5.1 Fitting dose-response models

6
Population and Metapopulation Effects

7
Community Effects

7.1 Species Richness

7.2 Analyzing mesocosm data

Principle Response Curves (PRC)[1] are commonly used for analyzing ecotoxicological mesocosm experiments. PRC is just a special form of Redundancy Analysis (RDA) and analyses the multivariate response to a treatment over time [2].

Here we will analyze the pyrifos data set from the publication[3] which is shipped with the vegan package.
